

Every participant on the network has a place. Every project has a home. Every business has a presence. Instead of navigating blockchain through wallet addresses and transaction lists, Dot Network transforms the ecosystem into a living, interactive network that anyone can explore.

Every claimed Node represents a real location on the network. Individuals use Nodes to build their identity, receive payments, showcase projects and connect with their communities. Businesses and protocols use Nodes to establish branded districts, launch products, organise services and create permanent destinations that users can discover naturally.

Payments become simple. Instead of copying wallet addresses, users send assets directly to verified identities and project hubs. Every transaction, claim, transfer and marketplace sale is reflected across the network in real time, allowing anyone to see the ecosystem evolve as value moves between people, projects and communities.

Dot Network is also the infrastructure layer for developers. Every Node can expose public information, integrate with applications, power payment flows and act as a discoverable endpoint for wallets, protocols and services built on Arc. Open APIs make it easy for third-party applications to integrate with the network and build experiences on top of it.

Discovery is at the core of the platform. Users can explore builders, creators, communities, businesses and protocols through an interactive map rather than static lists. Projects become destinations, trending communities become visible, and the relationships between participants are brought to life through the network itself.

As Arc grows, Dot Network grows with it. Every new participant strengthens the network, every new project expands the map and every new connection adds another piece to the digital geography of the ecosystem.

Dot Network is where identity, payments, discovery and infrastructure come together to make Arc more open, more accessible and fundamentally more human.

NOT AFFILIATED

Dot Network and the ARKNET Engine are not affiliated with Jeremy Allaire, Circle, or Arc. It is a visualization networking protocol built on Arc, inspired by that public interview and the broader story of connecting internet infrastructure with open money.
